

Vivekanand Education Society's Institute of Technology

An Autonomous Institute Affiliated to University of Mumbai
Hashu Advani Memorial Complex, Collector Colony, Chembur East, Mumbai - 400074.

Department of Information Technology

CERTIFICATE

This is to certify that Atharva Chavan of D15A semester VI, have successfully completed necessary experiments in the MAD & PWA Lab under my supervision in **VES Institute of Technology** during the academic year 2023-2024.

Lab Assistant

Subject Teacher

Mrs. Kajal Joseph

Principal

Head of Department

Dr. Mrs. Shalu Chopra

Name of the Course : MAD & PWA Lab

Course Code : ITL604

Year/Sem/Class : D15A **A.Y.:** 23-24

Faculty Incharge : Mrs. Kajal Joseph.

Lab Teachers : Mrs. Kajal Jewani.

Email : kajal.jewani@ves.ac.in

Programme Outcomes: The graduate will be able to:

PO1) Basic Engineering knowledge: An ability to apply the fundamental knowledge in mathematics, science and engineering to solve problems in Computer engineering.

PO2) Problem Analysis: Identify, formulate, research literature and analyze computer engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences and computer engineering and sciences.

PO3) Design/ Development of Solutions: Design solutions for complex computer engineering problems and design system components or processes that meet specified needs with appropriate consideration for public health and safety, cultural, societal and environmental considerations.

PO4) Conduct investigations of complex engineering problems using research-based knowledge and research methods including design of experiments, analysis and interpretation of data and synthesis of information to provide valid conclusions.

PO5) Modern Tool Usage: Create, select and apply appropriate techniques, resources and modern computer engineering and IT tools including prediction and modeling to complex engineering activities with an understanding of the limitations.

PO6) The Engineer and Society: Apply reasoning informed by contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to computer engineering practice.

PO7) Environment and Sustainability: Understand the impact of professional computer engineering solutions in societal and environmental contexts and demonstrate knowledge of and need for sustainable development.

PO8) Ethics: Apply ethical principles and commit to professional ethics and responsibilities and norms of computer engineering practice.

PO9) Individual and Team Work: Function effectively as an individual, and as a member or leader in diverse teams and in multidisciplinary settings.

PO10) Communication: Communicate effectively on complex engineering activities with the engineering community and with society at large, such as being able to comprehend and write effective reports and design documentation, make effective presentations and give and receive clear instructions.

PO11) Project Management and Finance: Demonstrate knowledge and understanding of computer engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments.

PO12) Life-long Learning: Recognize the need for and have the preparation and ability to engage in independent and lifelong learning in the broadest context of technological change.

Program specific Outcomes

PSO1) An ability to manage and analyze data / information effectively for making better decisions.

PSO2) Demonstrate the ability to use state of the art technologies and tools including Free and Open Source Software (FOSS) tools in developing software.

Lab Objectives:

Sr. No.	Lab Objectives
The Lab experiments aims:	
1	Learn the basics of the Flutter framework.
2	Develop the App UI by incorporating widgets, layouts, gestures and animation
3	Create a production ready Flutter App by including files and firebase backend service.
4	Learn the Essential technologies, and Concepts of PWAs to get started as quickly and efficiently as possible
5	Develop responsive web applications by combining AJAX development techniques with the jQuery JavaScript library.
6	Understand how service workers operate and also learn to Test and Deploy PWA.

Lab Outcomes:

Sr. No.	Lab Outcomes	Cognitive levels of attainment as per Bloom's Taxonomy
On Completion of the course the learner/student should be able to:		
1	Understand cross platform mobile application development using Flutter framework	L1, L2
2	Design and Develop interactive Flutter App by using widgets, layouts, gestures and animation	L3
3	Analyze and Build production ready Flutter App by incorporating backend services and deploying on Android / iOS	L3, L4
4	Understand various PWA frameworks and their requirements	L1, L2
5	Design and Develop a responsive User Interface by applying PWA Design techniques	L3
6	Develop and Analyse PWA Features and deploy it over app hosting solutions	L3, L4

Index

Sr. No	Experiment Title	LO	DOP	DOS	Grade
1.	To install and configure the Flutter Environment	LO1			
2.	To design Flutter UI by including common widgets.	LO2

MAD PWA Exp 1

Aim: Installation and Configuration of Flutter Environment.

Step 1: Download the installation bundle of the Flutter Software Development Kit for windows. To download Flutter SDK, Go to its official website <https://docs.flutter.dev/get-started/install>, you will get the following screen.

Step 2: Next, to download the latest Flutter SDK, click on the Windows icon. Here, you will find the download link for SDK.

Step 3: When your download is complete, extract the zip file and place it in the desired installation folder or location, for example, C: /Flutter.

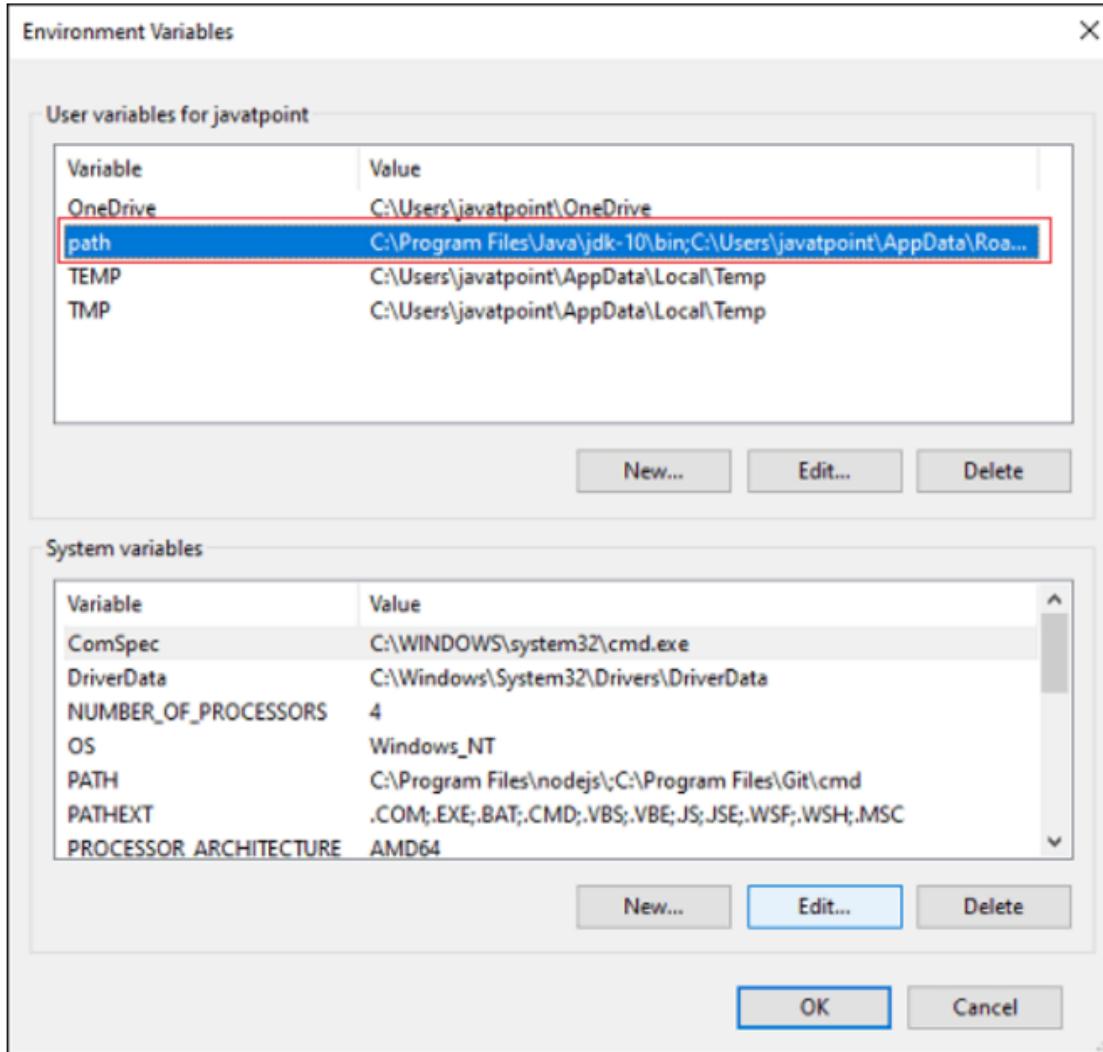

Step 4: To run the Flutter command in the regular windows console, you need to update the system path to include the flutter bin directory. The following steps are required to do this:

Step 4.1: Go to MyComputer properties -> advanced tab -> environment variables. You will get the following screen.

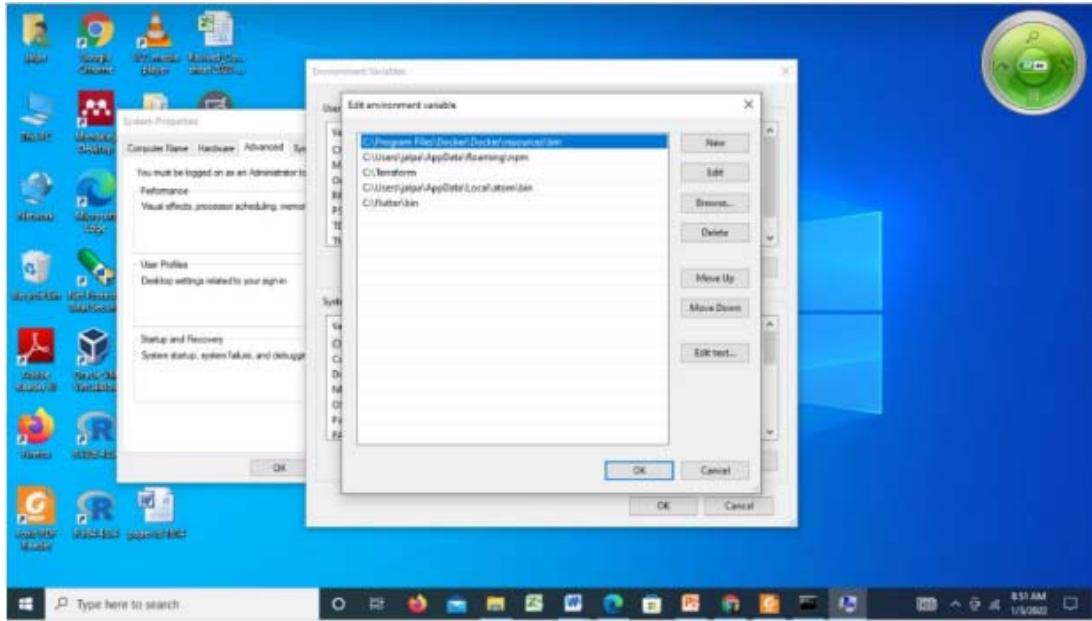

Name: Atharva Chavan

Div: D15A

Roll no: 10

Step 4.2: Now, select path -> click on edit. The following screen appears

Step 4.3: In the above window, click on New->write path of Flutter bin folder in variable value - > ok -> ok -> ok.

Step 5: Now, run the \$ flutter command in the command prompt.

Now, run the \$ flutter doctor command. This command checks for all the requirements of Flutter app development and displays a report of the status of your Flutter installation.

Step 6: When you run the above command, it will analyze the system and show its report, as shown in the below image. Here, you will find the details of all missing tools, which are required to run Flutter as well as the development tools that are available but not connected with the device.

Step 7: Install the Android SDK. If the flutter doctor command does not find the Android SDK tool in your system, then you need first to install the Android Studio IDE. To install Android Studio IDE, do the following steps.

Name: Atharva Chavan

Div: D15A

Roll no: 10

Step 7.1: Download the latest Android Studio executable or zip file from the official site.

Step 7.2: When the download is complete, open the .exe file and run it. You will get the following dialog box.

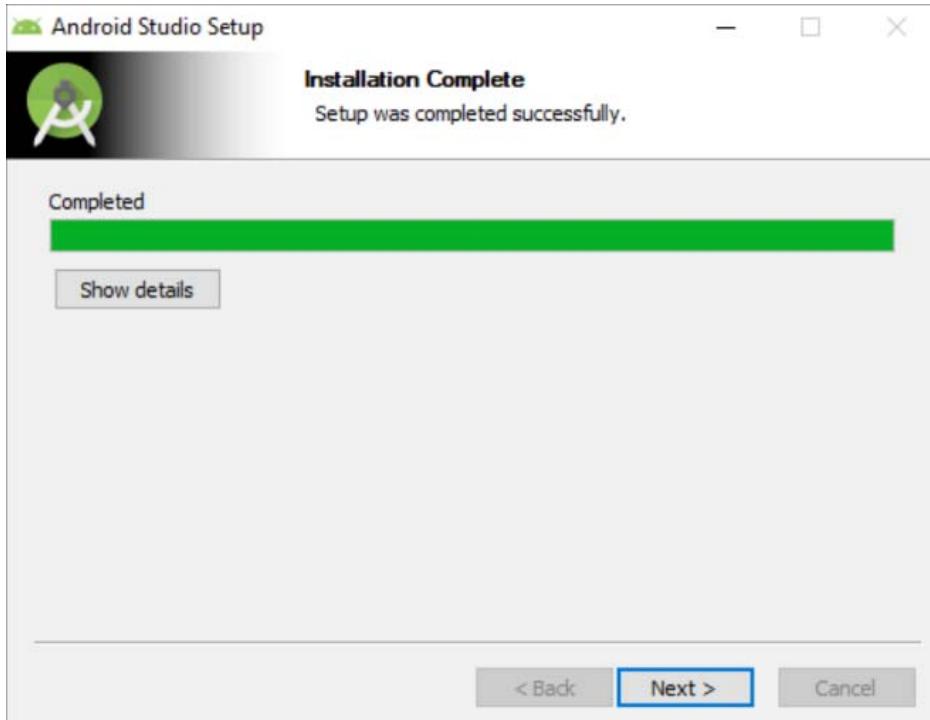

Step 7.3: Follow the steps of the installation wizard. Once the installation wizard completes, you will get the following screen.

Name: Atharva Chavan

Div: D15A

Roll no: 10

Step 7.4: In the above screen, click Next-> Finish. Once the Finish button is clicked, you need to choose the 'Don't import Settings option' and click OK. It will start the Android Studio.

Step 8: Next, you need to set up an Android emulator. It is responsible for running and testing the Flutter application.

Step 8.1: To set an Android emulator, go to Android Studio > Tools > Android > AVD Manager and select Create Virtual Device. Or, go to Help->Find Action->Type Emulator in the search box. You will get the following screen.

Step 8.2: Choose your device definition and click on Next.

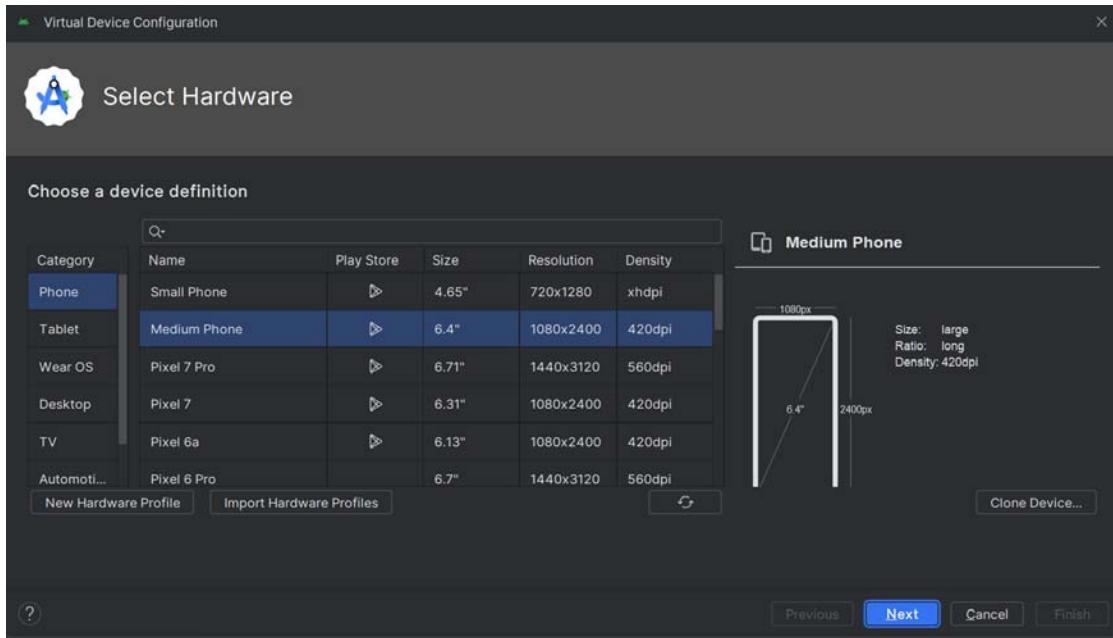

Step 8.3: Select the system image for the latest Android version and click on Next.

Name: Atharva Chavan

Div: D15A

Roll no: 10

Step 8.4: Now, verify the all AVD configuration. If it is correct, click on Finish. The following screen appears.

Step 8.5: Last, click on the icon pointed into the red color rectangle. The Android emulator displayed as below screen.

Step 9: Now, install the Flutter and Dart plugin for building Flutter applications in Android Studio. These plugins provide a template to create a Flutter application, give an option to run and debug Flutter application in the Android Studio itself. Do the following steps to install these plugins.

Step 9.1: Open the Android Studio and then go to File->Settings->Plugins.

Step 9.2: Now, search the Flutter plugin. If found, select Flutter plugin and click install. When you click on install, it will ask you to install Dart plugin as below screen. Click yes to proceed.

Step 9.3: Restart the Android Studio.

Code:

Name: Atharva Chavan

Div: D15A

Roll no: 10

```
import 'package:flutter/material.dart';
void main() {
  runApp(const MyApp());
}
class MyApp extends StatelessWidget {
  const MyApp({Key? key}) : super(key: key);
  @override
  Widget build(BuildContext context) {
    return MaterialApp(
      title: 'Welcome to Flutter',
      home: Scaffold(
        appBar: AppBar(
          title: const Text('Welcome to Flutter'),
        ),
        body: const Center(
          child: Text('Hello Atharva!!'),
        ),
      ),
    );
  }
}
```

Output:

Name: Atharva Chavan

Div: D15A

Roll no: 10

Name: Atharva Chavan

Div: D15A

Roll no: 10

The screenshot shows the Android Studio interface with the following details:

- Project View:** Shows the directory structure of the Flutter project 'atharva_hello_world'.
- Code Editor:** The 'main.dart' file is open, containing the following Dart code:

```
import 'package:flutter/material.dart';

void main() {
  runApp(const MyApp());
}

class MyApp extends StatelessWidget {
  const MyApp({Key? key}) : super(key: key);
  @override
  Widget build(BuildContext context) {
    return MaterialApp(
      title: 'Welcome to Flutter',
      home: Scaffold(
        appBar: AppBar(
          title: const Text('Welcome to Flutter'),
        ),
        body: const Center(
          child: Text('Hello Atharva!!'),
        ),
      ),
    );
  }
}
```
- Emulator:** A Pixel 4 API 29 emulator is running, displaying the app's UI with the title 'Welcome to Flutter' and the text 'Hello Atharva!'.
- Toolbars and Panels:** Various toolbars like Version Control, Run, Problems, Terminal, Dart Analysis, Logcat, App Inspection, Profiler, Event Log, Layout Inspector, and Emulator are visible along the bottom.

Experiment No.	02
Experiment Title.	To design Flutter UI by including common widgets.
Roll No.	10
Name	Atharva Chavan
Class	D15A
Subject	MAD & PWA Lab
Lab Outcome	LO2: Design and Develop interactive Flutter App by using widgets, layouts, gestures and animation
Grade:	

MAD PWA Exp 2

Aim: To design Flutter UI by including common widgets.

Theory:

We can split the Flutter widget into two categories:

1. Visible (Output and Input)
2. Invisible (Layout and Control)

1. Visible widget

The visible widgets are related to the user input and output data. Some of the important types of

this widget are:

1. Text

A Text widget holds some text to display on the screen. We can align the text widget by using

textAlign property, and style property allow the customization of Text that includes font, font

weight, font style, letter spacing, color, and many more.

2. Button

This widget allows you to perform some action on click. Flutter does not allow you to use the

Button widget directly; instead, it uses a type of buttons like a FlatButton and a RaisedButton.

3. Image

This widget holds the image which can fetch it from multiple sources like from the asset

folder or directly from the URL. It provides many constructors for loading image, which

are given below:

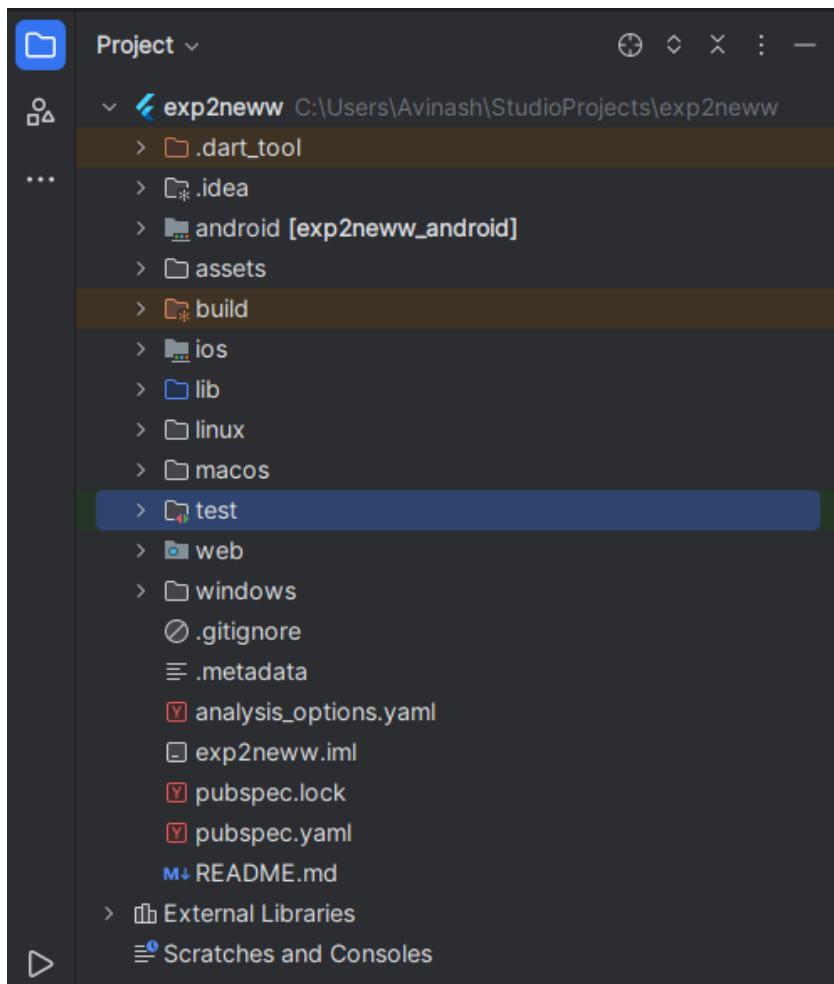

- o `Image`: It is a generic image loader, which is used by `ImageProvider`.
- o `asset`: It load image from your project asset folder.
- o `file`: It loads images from the system folder.
- o `memory`: It load image from memory.
- o `network`: It loads images from the network.

To add an image in the project, you need first to create an assets folder where you keep

your images and then add the below line in `pubspec.yaml` file.

assets:

- assets/comp.jpg

File structure:**Code:**

```
import 'package:flutter/material.dart';

void main() {
    runApp(MyApp());
}

class MyApp extends StatelessWidget {
    @override
    Widget build(BuildContext context) {
        return MaterialApp(
            title: 'Jio Saavn',
            home: HomeScreen(),
        );
    }
}

class HomeScreen extends StatelessWidget {
```

```
@override
Widget build(BuildContext context) {
    return Scaffold(
        appBar: AppBar(
            title: Text('Welcome To Jio Saavn'),
            backgroundColor: Colors.transparent,
            elevation: 0,
        ),
        body: Center(
            child: Column(
                mainAxisAlignment: MainAxisAlignment.center,
                children: [
                    Image.asset(
                        'assets/jiosaavn.jpg', // Update with your actual logo
path
                        width: 150, // Adjust the width as needed
                        height: 150, // Adjust the height as needed
                    ),
                    SizedBox(height: 16),
                    Text(
                        'JIO SAAVN',
                        style: TextStyle(
                            fontSize: 24,
                            fontWeight: FontWeight.bold,
                        ),
                    ),
                    SizedBox(height: 8),
                    Text(
                        'One stop destination for your entire music taste',
                        style: TextStyle(
                            fontSize: 16,
                            color: Colors.grey,
                        ),
                    ),
                    ],
                ),
            );
    }
}
```

Experiment No.	03
Experiment Title.	To include icons, images, fonts in Flutter app
Roll No.	10
Name	Atharva Chavan
Class	D15A
Subject	MAD & PWA Lab
Lab Outcome	LO2: Design and Develop interactive Flutter App by using widgets, layouts, gestures and animation
Grade:	

MAD PWA Exp 3

Aim: To include icons, images and fonts in flutter app

Theory:

Flutter, Google's open-source UI toolkit, empowers developers to craft visually appealing and highly performant applications. A fundamental aspect of creating a compelling user interface lies in the seamless integration of icons, images, and custom fonts.

Icons

Icons serve as intuitive visual cues, aiding users in navigation and comprehension. Flutter provides an extensive set of built-in icons, and developers can easily integrate custom icons. Icons contribute to a consistent design language and enhance the overall user experience.

Principles:

1. Selecting Icon Packages: Developers often leverage existing icon packages, such as "material_icons" or "font_awesome_flutter," to access a diverse range of symbols. This streamlines the integration process and ensures a cohesive visual language.
2. Installation and Implementation: The chosen icon package is added to the project's dependencies. Icons can then be effortlessly implemented using the Icon widget, specifying the desired icon type, size, and color.

Images

Images play a pivotal role in conveying information, setting the mood, and creating an immersive user experience. Flutter supports various image formats and provides mechanisms for both local and network-based image integration.

Principles:

1. Organizing Image Assets: Structuring image assets within the 'assets' folder and updating the pubspec.yaml file facilitates proper asset management. This step ensures clarity and ease of access for images within the Flutter project.
2. Loading Images: Utilizing the Image.asset widget for local images and Image.network for network images simplifies the integration process. This allows developers to incorporate visuals seamlessly into their application interfaces.

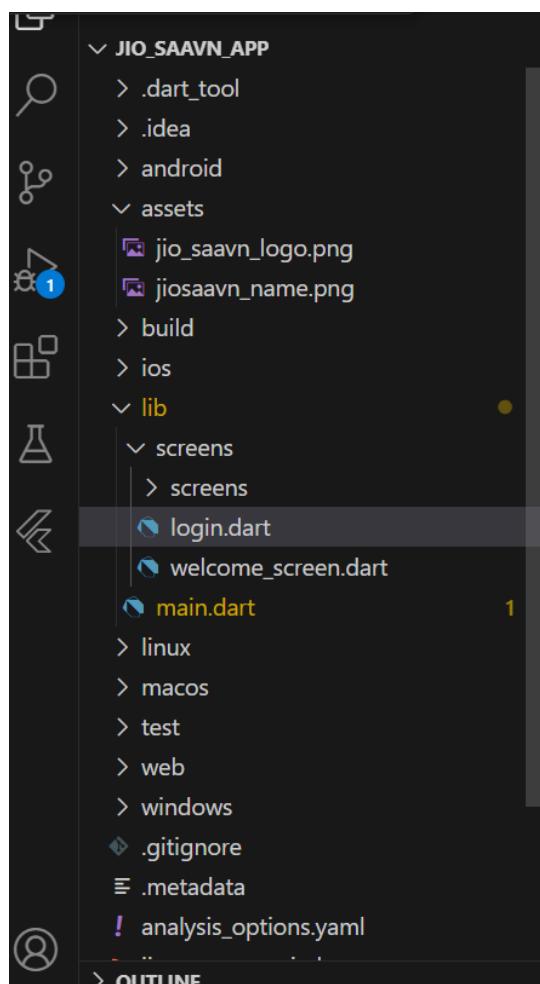

Fonts

Custom fonts contribute to brand identity and enhance the overall aesthetics of an application. Flutter enables the integration of custom fonts, allowing developers to align the typography with the app's design principles.

Principles:

1. Adding Font Files: Placing font files within a 'fonts' folder and updating the pubspec.yaml file establishes a clear structure for font assets. This practice simplifies the inclusion of custom fonts in Flutter projects.
2. Loading and Applying Fonts: Integrating custom fonts involves specifying the font family and style using the TextStyle widget. This ensures consistent and visually appealing text elements throughout the application.

File structure:

Code:

```
//main.dart

import 'package:flutter/material.dart';
import 'screens/login.dart';
import 'screens/welcome_screen.dart';

void main() {
  runApp(const MyApp());
}

class MyApp extends StatelessWidget {
  const MyApp({Key? key}) : super(key: key);

  @override
  Widget build(BuildContext context) {
    return MaterialApp(
      title: 'JioSaavn App',
      theme: ThemeData(
        primarySwatch: Colors.blue,
      ),
      home: const WelcomePage(),
    );
  }
}
```

```
//login.dart
```

```
import 'package:flutter/material.dart';
import 'package:font_awesome_flutter/font_awesome_flutter.dart';

void main() {
  runApp(MyApp());
}

class MyApp extends StatelessWidget {
  @override
  Widget build(BuildContext context) {
    return MaterialApp(
      home: LoginScreen(),
    );
  }
}

class LoginScreen extends StatelessWidget {
  @override
```

```
Widget build(BuildContext context) {
  return Scaffold(
    backgroundColor: Colors.black,
    body: Column(
      mainAxisAlignment: MainAxisAlignment.end,
      children: [
        Padding(
          padding: const EdgeInsets.all(25.0),
          child: Column(
            mainAxisAlignment: MainAxisAlignment.center,
            children: [
              // Jio Saavn Logo
              Image.asset(
                'assets/jiosaavn_name.png', // Path to Jio Saavn logo
                height: 150,
                width: 200,
              ),
              SizedBox(height: 20),
              Text(
                'Login and enjoy more than 80 million songs',
                style: TextStyle(
                  fontSize: 14,
                  fontWeight: FontWeight.normal,
                  color: Color.fromRGBO(198, 202, 189, 189),
                ),
              ),
              SizedBox(height: 20),
              // Login with Jio Button
              Container(
                width: double.infinity,
                margin: EdgeInsets.symmetric(horizontal: 35),
                decoration: BoxDecoration(
                  color: Color.fromRGBO(0, 255, 240, 1),
                  borderRadius: BorderRadius.circular(12),
                ),
                child: ElevatedButton(
                  onPressed: () {
                    // Handle Jio login
                  },
                  style: ElevatedButton.styleFrom(
                    primary: Colors
                      .transparent, // Transparent color for elevated
button
                    shape: RoundedRectangleBorder(
                      borderRadius: BorderRadius.circular(8),
                    ),
                  ),
                ),
              ),
            ],
          ),
        ),
      ],
    ),
  );
}
```

```
        ),
        child: Padding(
            padding: const EdgeInsets.all(16.0),
            child: Text(
                "Login with Jio",
                style: TextStyle(fontSize: 16, color: Colors.white),
            ),
        ),
    ),
),
),
),
),
SizedBox(height: 10),  
  
Text(
    'Or',
    style: TextStyle(
        fontSize: 16,
        fontWeight: FontWeight.bold,
        color: Colors.white,
    ),
),
),
SizedBox(height: 20),  
  
// Social Logins
Row(
    mainAxisAlignment: MainAxisAlignment.spaceAround,
    children: [
        _buildSocialLoginButton(
            FontAwesomeIcons.google, "", Colors.red, () {
                // Handle Google login
        }),
        _buildSocialLoginButton(
            FontAwesomeIcons.facebook, "", Colors.blue, () {
                // Handle Facebook login
        }),
        _buildSocialLoginButton(Icons.mail, "", Colors.orange, () {
            // Handle Mail login
        }),
    ],
),
),
SizedBox(height: 20),  
  
Text(
    'By continuing, you agree to our terms and privacy policy',
    style: TextStyle(
        fontSize: 11,
        fontWeight: FontWeight.normal,
        color: Colors.white,
```

```
        ),
        ],
        ),
        ],
        ),
        ],
        ),
        );
    }

Widget _buildSocialLoginButton(
    IconData icon, String text, Color color, VoidCallback onPressed) {
    return InkWell(
        onTap: onPressed,
        child: Column(
            children: [
                CircleAvatar(
                    radius: 20, // Reduced size
                    backgroundColor: color,
                    child: Icon(icon, size: 16, color: Colors.white),
                ),
                SizedBox(height: 8),
                Text(
                    text,
                    style: TextStyle(color: Colors.white),
                ),
            ],
        );
    );
}
```

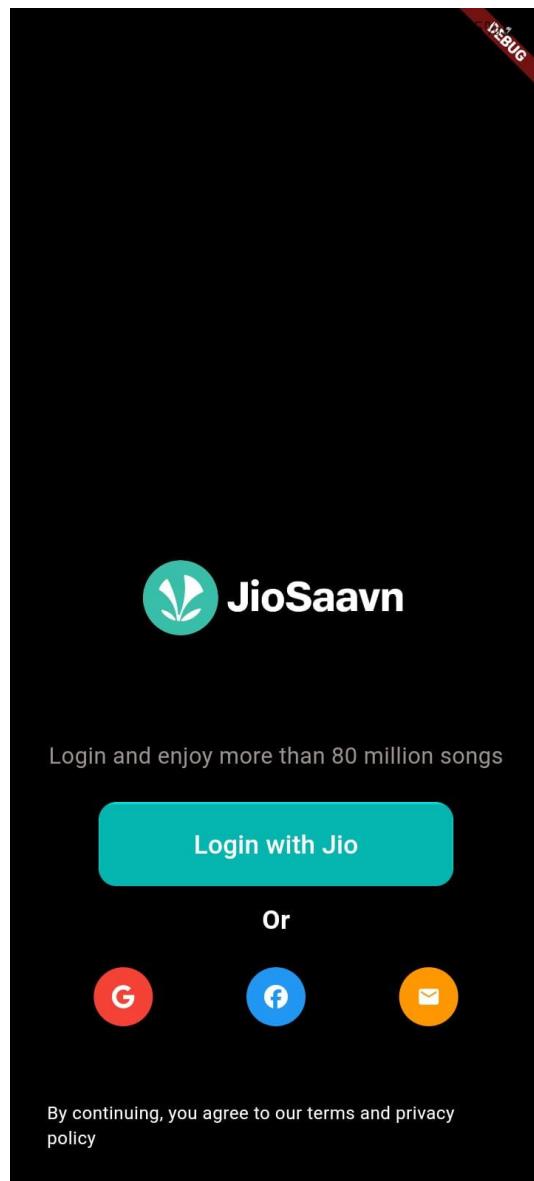

Name: Atharva Chavan

Roll no: 10

Batch 'A'

Output:

Conclusion:

In conclusion, the integration of icons, images, and fonts in Flutter applications is foundational to creating visually stunning and engaging user interfaces. By adhering to best practices, developers can uphold design consistency, enhance user experience, and bring forth applications that resonate aesthetically with their target audience.

MAD PWA Lab Exp 4

Aim: To create an interactive Form using form widget

Theory:

Forms play a vital role in collecting and processing user input in mobile applications. Flutter provides a powerful Form widget that simplifies the process of creating interactive and responsive forms. This theory covers the fundamental concepts and practices involved in creating an interactive form using the Form widget.

Key Concepts:

Form Widget:

The Form widget serves as a container for form elements, helping to organize and manage user input. It enables the grouping of various form fields and facilitates form-level operations like validation and submission.

TextFields:

Text input is a common element in forms, and Flutter provides the TextFormField widget for this purpose. TextFormField allows developers to collect textual input from users and supports customization through attributes like decoration and validator.

Form Validation:

The Form widget includes a powerful validation mechanism using the validator property in form fields. Developers can define custom validation functions to ensure that user input meets specific criteria before submission.

Form Submission:

Forms typically include a mechanism for submitting user input. Flutter provides the onSaved property to handle the form data once it passes validation. Developers can implement custom logic to process and store the validated form data.

Form Key:

Managing the form's state is crucial for interactivity. Flutter uses a GlobalKey<FormState> to interact with the form's state.

The key enables actions such as resetting the form, validating all form fields, and accessing the form's current state.

Best Practices:

Organizing Form Elements:

Structure the form using a Column or ListView for better organization and readability. Group related form fields together to enhance user experience.

Error Handling:

Leverage the validator property to provide meaningful error messages to users when form input is invalid.

Display errors in a user-friendly manner, enhancing the overall user experience.

Responsive Design:

Ensure that the form is responsive to different screen sizes and orientations.

Use Flutter's layout widgets to create a consistent and visually appealing form across devices.

Accessibility:

Implement accessibility features to ensure users with disabilities can interact with and understand the form.

Use proper labels, hints, and error messages to enhance accessibility.

Code & Implementation:

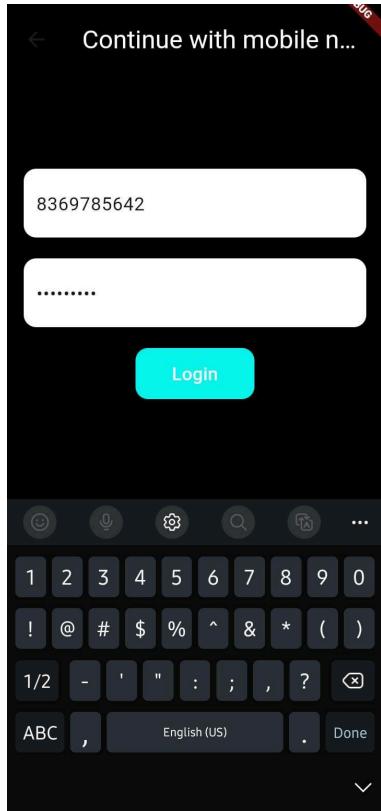

```
//mobilenumbers.dart
import 'package:flutter/material.dart';
import 'package:jio_saavn_app/screens/home.dart';

class MobileNumberPage extends StatelessWidget {
  @override
  Widget build(BuildContext context) {
    return Scaffold(
      appBar: AppBar(
        title: Text(
          'Continue with mobile number',
          style: TextStyle(color: Colors.white),
        ),
    ),
```

```
        backgroundColor: Colors.black,
),
backgroundColor: Colors.black,
body: Padding(
padding: const EdgeInsets.all(16.0),
child: Column(
mainAxisAlignment: MainAxisAlignment.center,
children: [
TextField(
keyboardType: TextInputType.phone,
decoration: InputDecoration(
hintText: 'Enter mobile number',
fillColor: Colors.white,
filled: true,
border: OutlineInputBorder(
borderRadius: BorderRadius.circular(12.0),
borderSide: BorderSide.none,
),
),
),
),
),
),
SizedBox(height: 20),  
  
// Password TextField
TextField(
obscureText: true, // Hide the entered text for passwords
decoration: InputDecoration(
hintText: 'Enter password',
fillColor: Colors.white,
filled: true,
border: OutlineInputBorder(
borderRadius: BorderRadius.circular(12.0),
borderSide: BorderSide.none,
),
),
),
),
),
),
SizedBox(height: 20),  
  
ElevatedButton(
onPressed: () {
Navigator.push(

```

```
        context,
        MaterialPageRoute(builder: (context) => HomeScreen())),
    );
    // Handle mobile number login
    // You can implement your logic to verify the mobile
    number and navigate to the next screen
},
style: ElevatedButton.styleFrom(
    primary: Color.fromRGBO(0, 255, 240, 1), // Aqua color
    shape: RoundedRectangleBorder(
        borderRadius: BorderRadius.circular(12.0),
    ),
),
child: Padding(
    padding: const EdgeInsets.all(12.0),
    child: Text(
        'Login',
        style: TextStyle(fontSize: 16, color: Colors.white),
    ),
),
),
),
],
),
),
);
}
}
```

Conclusion: Creating interactive forms in Flutter involves leveraging the Form widget, managing form state, and incorporating best practices for a seamless user experience. By following these principles, developers can design robust and user-friendly forms in their Flutter applications.

MAD PWA Lab Exp 5

Aim: To apply navigation, routing and gestures in Flutter app.

Theory:

In the realm of Flutter app development, the effective application of navigation, routing, and gestures is pivotal for creating an intuitive and engaging user experience. This theoretical exploration delves into the foundational concepts and principles guiding the implementation of navigation, routing, and gestures in Flutter applications.

Navigation and Routing

Navigation is the process of moving between different screens or sections within an app. Flutter employs a structured routing system to facilitate seamless transitions between these screens. This system is driven by the following principles:

Navigator.push()

The Navigator.push() method is employed to navigate from one screen to another by adding a new page to the navigation stack. This method is integral to the dynamic flow of a Flutter application.

Principles:

1. Screen Transition:

Invoking Navigator.push() triggers a transition to a new screen, pushing it onto the navigation stack.

This method is typically used when moving from one screen to another, such as transitioning from a home screen to a details screen.

2. Named Routes:

Navigator.pushNamed() is a variation of this method used when navigating to a screen defined by a named route.

Named routes provide a clear and maintainable way to organize and navigate between different screens in the app.

3. Arguments:

The method allows the passing of arguments to the destination screen, enabling dynamic content rendering.

Arguments facilitate the customization of the new screen based on the context of the navigation.

Navigator.pop()

Conversely, the Navigator.pop() method is employed to remove the current screen from the navigation stack, returning to the previous screen. It plays a vital role in controlling the flow of the application.

Principles:

1. Screen Removal:

When Navigator.pop() is called, the current screen is popped off the navigation stack, reverting to the previous screen.

This method is typically used in scenarios where a user completes a task on one screen and returns to the previous screen.

2. Data Passing:

Information can be passed back to the previous screen using the Navigator.pop() method.

This allows for a seamless exchange of data between screens, enhancing the overall user experience.

3. Return Values:

Developers can retrieve values returned from the popped screen, enabling dynamic updates or actions based on the user's interactions.

Code:

```
//home.dart  
  
import 'package:flutter/material.dart';  
  
import 'package:jio_saavn_app/screens/library.dart';  
  
import 'package:jio_saavn_app/screens/search.dart';
```

```
import 'navigation_bar.dart'; // Import the custom navigation bar
```

```
class HomeScreen extends StatefulWidget {  
    @override  
    _HomeScreenState createState() => _HomeScreenState();  
}  
}
```

```
class _HomeScreenState extends State<HomeScreen> {
```

```
int _selectedIndex = 0;
```

@override

```
Widget build(BuildContext context) {
```

```
return Scaffold(
```

MAD PWA Lab Exp 6

Aim: To Set Up Firebase with Flutter for iOS and Android Apps

Theory:

Firebase is a powerful platform provided by Google that offers a variety of services for mobile and web applications, including real-time databases, authentication, cloud functions, and more. When combined with Flutter, a popular open-source UI software development toolkit, developers can create cross-platform apps for iOS and Android efficiently. This guide will walk you through the process of setting up Firebase with Flutter for both iOS and Android platforms.

Prerequisites

Before you begin, make sure you have the following prerequisites:

Flutter Installed: Ensure that you have Flutter and Dart installed on your development machine.

Firebase Account: Create a Firebase account if you don't have one already. Visit the Firebase Console to set up a new project.

Flutter IDE: Use an integrated development environment (IDE) like Visual Studio Code or Android Studio with Flutter and Dart plugins installed.

Step 1: Create a Firebase Project

1.1. Go to the Firebase Console, click on "Add Project," and follow the prompts to create a new project.

1.2. Once the project is created, click on "Add App" to add both iOS and Android apps to your project.

Step 2: Configure iOS App

2.1. For iOS, click on the iOS icon in the Firebase Console and follow the setup instructions. Download the GoogleService-Info.plist file and add it to your Flutter project's ios/Runner directory.

2.2. Update your ios/Podfile to include the necessary Firebase dependencies. Run pod install in the ios directory.

Step 3: Configure Android App

3.1. For Android, click on the Android icon in the Firebase Console and follow the setup instructions. Download the google-services.json file and add it to your Flutter project's android/app directory.

3.2. Update your android/build.gradle and android/app/build.gradle files with the necessary dependencies.

Step 4: Add FlutterFire Plugins

- 4.1. Open your pubspec.yaml file and add the necessary FlutterFire plugins for the Firebase services you want to use, such as authentication, Firestore, or Cloud Messaging.
- 4.2. Run flutter pub get in your terminal to fetch the dependencies.

Step 5: Initialize Firebase in Your Flutter App

- 5.1. Import the Firebase packages in your Dart code and initialize Firebase in the main.dart file.

Step 6: Test Firebase Integration

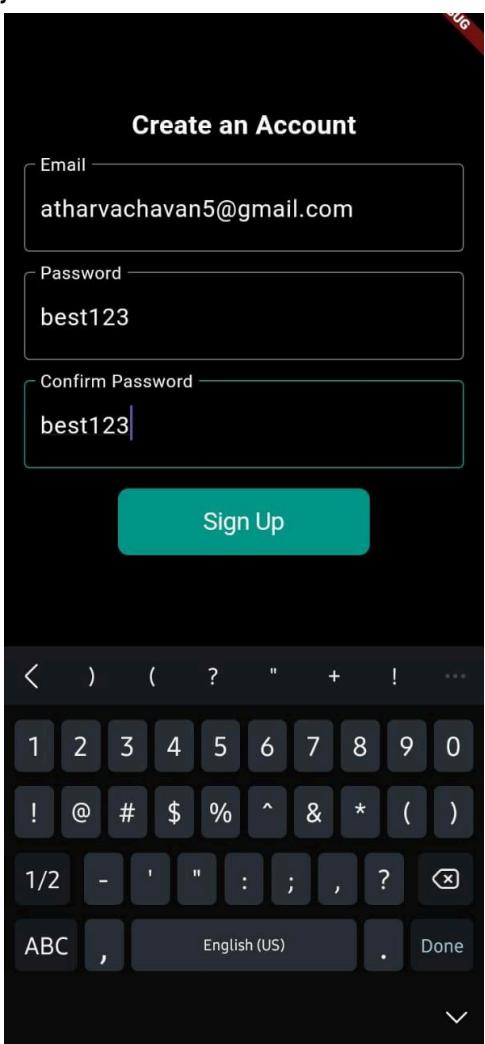

- 6.1. Write a simple test to ensure Firebase is correctly integrated. For example, try initializing Firestore or authenticate a user.

Code & Implementation:

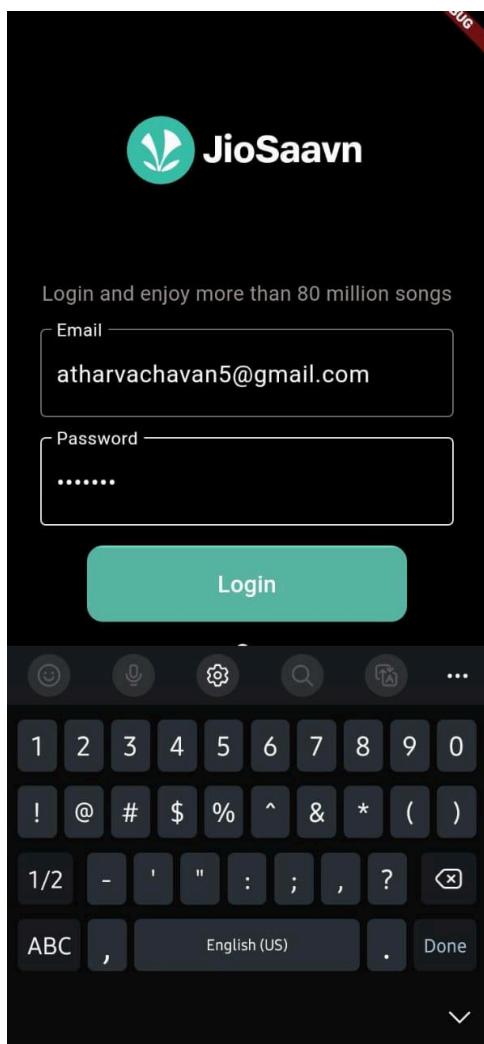

```
//main.dart
import 'package:firebase_core/firebase_core.dart';
import 'package:flutter/material.dart';
import 'package:jio_saavn_auth.firebaseio_options.dart';
import 'package:jio_saavn_auth/screens/library_screen.dart';
import 'package:jio_saavn_auth/screens/welcome_screen.dart';
import 'package:provider/provider.dart';

Future<void> main() async {
  WidgetsFlutterBinding.ensureInitialized();
  await Firebase.initializeApp(
    options: DefaultFirebaseOptions.currentPlatform,
  );
  runApp(
    ChangeNotifierProvider(
      create: (context) => LikedSongsModel(),
      child: MyApp(),
    ),
  );
}
```

}

Conclusion:

In conclusion, integrating Firebase with Flutter for iOS and Android apps provides a robust foundation for building feature-rich, cross-platform applications. By following the steps outlined in this guide, you have established a seamless connection between your Flutter project and Firebase, unlocking a plethora of services such as authentication, real-time databases, and cloud functions. This integration not only enhances the app's functionality but also simplifies the management of backend services, making development more efficient.

Experiment - 7

Aim: To write meta data of your Ecommerce PWA in a Web app manifest file to enable add to home screen feature.

Theory:

Regular Web App

A regular web app is a website that is designed to be accessible on all mobile devices such that the content gets fit as per the device screen. It is designed using a web technology stack (HTML, CSS, JavaScript, Ruby, etc.) and operates via a browser. They offer various native-device features and functionalities. However, it entirely depends on the browser the user is using. In other words, it might be possible that you can access a native-device feature on Chrome but not on Safari or Mozilla Firefox because the browsers are incompatible with that feature.

Progressive Web App

Progressive Web App (PWA) is a regular web app, but some extras enable it to deliver an excellent user experience. It is a perfect blend of desktop and mobile application experience to give both platforms to the end-users.

Difference between PWAs vs. Regular Web Apps:

A Progressive Web is different and better than a Regular Web app with features like:

1. Native Experience

Though a PWA runs on web technologies (HTML, CSS, JavaScript) like a Regular web app, it gives user experience like a native mobile application. It can use most native device features, including push notifications, without relying on the browser or any other entity. It offers a seamless and integrated user experience that it is quite tough for one to differentiate between a PWA and a Native application by considering its look and feel.

2. Ease of Access

Unlike other mobile apps, PWAs do not demand longer download time and make memory space available for installing the applications. The PWAs can be shared and installed by a link, which cuts down the number of steps to install and use. These applications can easily keep an app icon on the user's home screen, making the app easily accessible to the users and helps the brands remain in the users' minds, and improving the chances of interaction.

3. Faster Services

PWAs can cache the data and serve the user with text stylesheets, images, and other web content even before the page loads completely. This lowers the waiting time for the end-users and helps the

brands improve the user engagement and retention rate, which eventually adds value to their business.

4. Engaging Approach

As already shared, the PWAs can employ push notifications and other native device features more efficiently. Their interaction does not depend on the browser user uses. This eventually improves the chances of notifying the user regarding your services, offers, and other options related to your brand and keeping them hooked to your brand. In simpler words, PWAs let you maintain the user engagement and retention rate.

5. Updated Real-Time Data Access

Another plus point of PWAs is that these apps get updated on their own. They do not demand the end-users to go to the App Store or other such platforms to download the update and wait until installed. In this app type, the web app developers can push the live update from the server, which reaches the apps residing on the user's devices automatically. Therefore, it is easier for the mobile app developer to provide the best of the updated functionalities and services to the end-users without forcing them to update their app.

The main features are:

Progressive — They work for every user, regardless of the browser chosen because they are built at the base with progressive improvement principles.

Responsive — They adapt to the various screen sizes: desktop, mobile, tablet, or dimensions that can later become available.

App-like — They behave with the user as if they were native apps, in terms of interaction and navigation.

Updated — Information is always up-to-date thanks to the data update process offered by service workers.

Secure — Exposed over HTTPS protocol to prevent the connection from displaying information or altering the contents.

Searchable — They are identified as “applications” and are indexed by search engines.

Reactivable — Make it easy to reactivate the application thanks to capabilities such as web notifications.

```

Open folder in VS code and click go live at bottom right corner

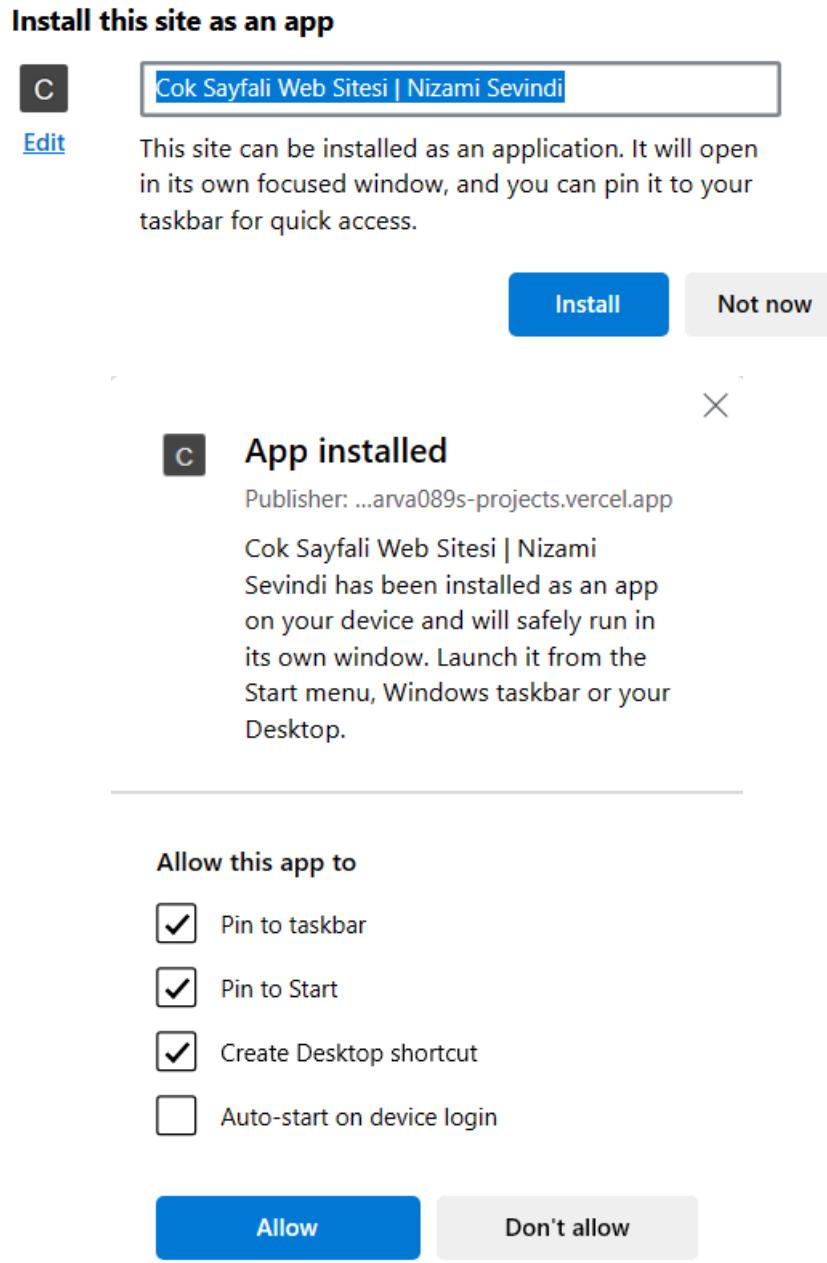

Open your hosted site on Microsoft Edge

Click on 3 dots
click on Apps
select install app option

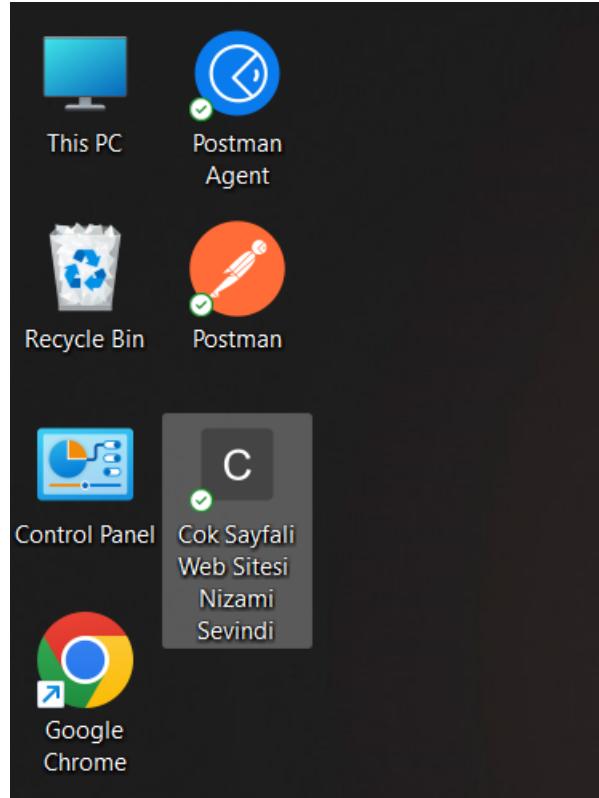

Click on Install

App icon will appear at the bottom

Output:

Desktop App Created Successfully.
Open Desktop App:

A screenshot of a web browser displaying a fast food delivery website. The header features a logo with 'NS' and navigation links for Home, About, Menu, Products, Review, Contact, and Blog. A search bar and a shopping cart icon are also present. The main content area has a wooden background on the left and a large image of a pizza on the right. The pizza is topped with ham, cheese, arugula, and orange slices. The text 'Fast Food Delivery' is prominently displayed in the center. Below it, a placeholder text block reads: 'Lorem Ipsum Dolor Sit Amet Consectetur Adipisicing Elit. Incidunt Perferendis Obcaecati Iste Voluptatum, Quaerat Nihil Magnam Numquam Sint?'. A 'Order Now' button is located at the bottom left. The browser's taskbar at the bottom shows various open tabs and system icons.

Conclusion:

In this experiment, we have successfully created a basic progressive web app of our web page and installed it in our desktop successfully.

Subject	MAD & PWA Lab
Lab Outcome	LO5: Design and Develop a responsive User Interface by applying PWA Design techniques
Grade:	

MAD and PWA Lab

Name: Atharva Chavan

Class: D15A

Roll no:10

Experiment – 8

Aim: To code and register a service worker, and complete the install and activation process for a new service worker for the E-commerce PWA.

Theory:

Service Worker is a script that works on browser background without user interaction independently. Also, It resembles a proxy that works on the user side. With this script, you can track network traffic of the page, manage push notifications and develop "offline first" web applications with Cache API.

Things to note about Service Worker:

- A service worker is a programmable network proxy that lets you control how network requests from your page are handled.
- Service workers only run over HTTPS. Because service workers can intercept network requests and modify responses, "man-in-the-middle" attacks could be very bad.
- The service worker becomes idle when not in use and restarts when it's next needed. You cannot rely on a global state persisting between events. If there is information that you need to persist and reuse across restarts, you can use IndexedDB databases.

What can we do with Service Workers?

- You can dominate **Network Traffic**

You can manage all network traffic of the page and do any manipulations. For example, when the page requests a CSS file, you can send plain text as a response or when the page requests an HTML file, you can send a png file as a response. You can also send a true response too.

- You can **Cache**

You can cache any request/response pair with Service Worker and Cache API and you can access these offline content anytime.

- You can manage **Push Notifications**

You can manage push notifications with Service Worker and show any information message to the user.

- You can **Continue**

Although Internet connection is broken, you can start any process with Background Sync of Service Worker.

Here's a theory on how to code and register a service worker and complete the installation and activation process for a new service worker:

Service Worker Registration:

Start by creating a JavaScript file for the service worker (e.g., service-worker.js).

In your main HTML file (e.g., index.html), include code to register the service worker. This code typically resides within a `<script>` tag and should be placed near the bottom of the `<body>` tag to ensure the DOM content is fully loaded before registering the service worker.

Use the `navigator.serviceWorker.register()` method to register the service worker script. This method takes the path to the service worker script as its parameter.

It's a best practice to perform feature detection to check if the browser supports service workers before attempting to register one.

Service Worker Installation:

Once the service worker is registered, the browser will attempt to install it.

Inside the service worker script, listen for the `install` event. This event is triggered when the browser detects a new service worker for the first time.

Upon installation, you can perform tasks such as caching static assets (HTML, CSS, JavaScript, images) using the Cache API. This ensures that the application shell is available offline.

During installation, pre-cache essential assets by fetching and storing them in the cache storage.

Service Worker Activation:

After the service worker is successfully installed, it enters the activation phase.

Listen for the activate event inside the service worker script. This event is triggered once the service worker becomes active.

During activation, you can clean up old caches from previous versions of the service worker to ensure the application uses the latest assets.

Remove outdated caches using the CacheStorage API, typically by comparing cache keys to the current version and deleting obsolete caches.

Testing and Debugging:

Test the service worker functionality thoroughly, both in online and offline scenarios, to ensure proper caching and offline behavior.

Use browser developer tools to debug service worker code, inspect cache storage, and monitor service worker lifecycle events.

Consider implementing logging and error handling within the service worker to facilitate debugging in production environments.

Code:

index.html:

```

App.js:

```
if ('serviceWorker' in navigator) {

    window.addEventListener('load', () => {
        navigator.serviceWorker.register('/service-worker.js')
            .then(registration => {
                console.log('Service Worker registered with scope:', registration.scope);
            })
            .catch(error => {
                console.error('Service Worker registration failed:', error);
            });
    });
}
```

Service-worker.js:

```
// service-worker.js

const cacheName = 'gfg-pwa-v1';
const assetsToCache = [
    '/',
    '/index.html',
    '/main.css',
    '/app.js'
    // Add more files and assets here as needed
];

self.addEventListener('install', event => {
    event.waitUntil(
        caches.open(cacheName)
            .then(cache => {
                return cache.addAll(assetsToCache);
            })
    );
});

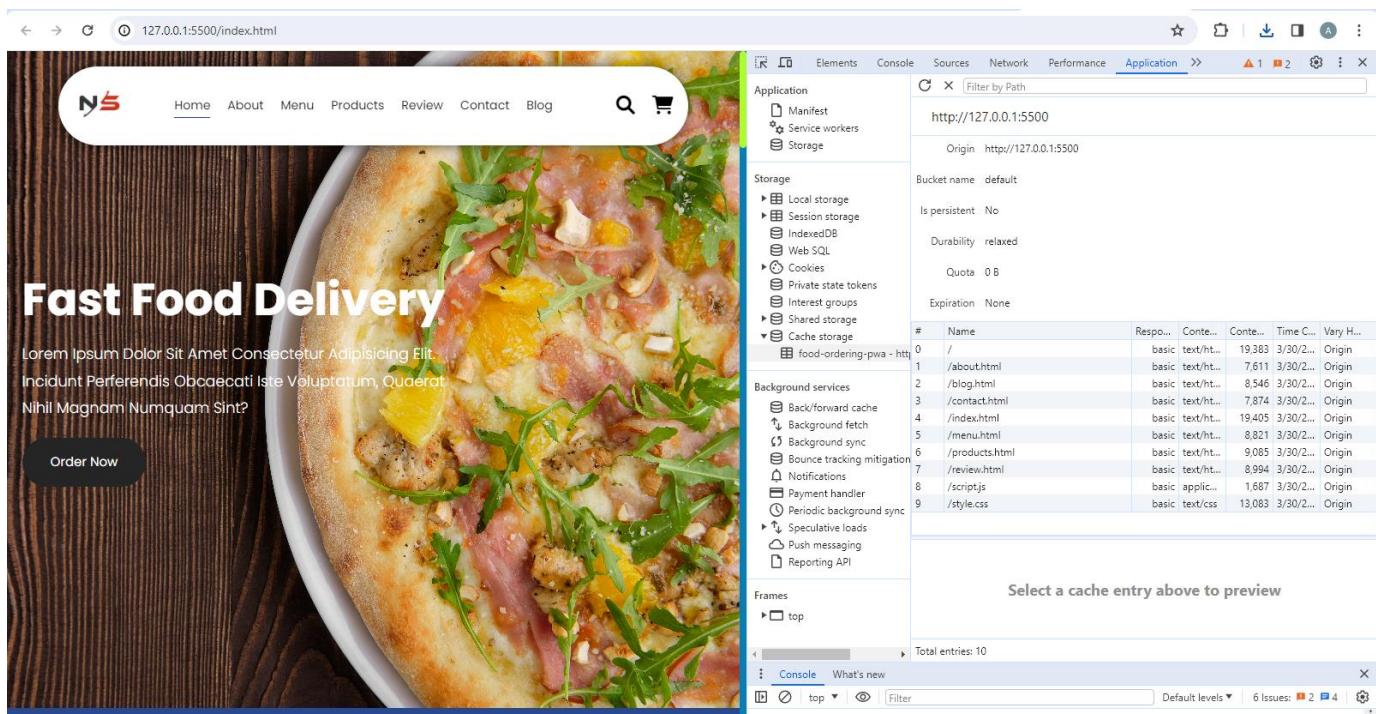

self.addEventListener('activate', event => {
    event.waitUntil(
        caches.keys().then(cacheNames => {
            return Promise.all(
                cacheNames.filter(name => {
                    return name !== cacheName;
                }).map(name => {
                    return caches.delete(name);
                })
            );
        })
    );
});
```

Steps for Execution:-

- Create a folder and put all 4 files main.css , service-worker.js, app.js, index.html
- Open visual studio

- Install extension Live server
- Open folder in visual studio open index.html
- On bottom right corner click go Live
- It will open html page in browser
- Go to developer tools

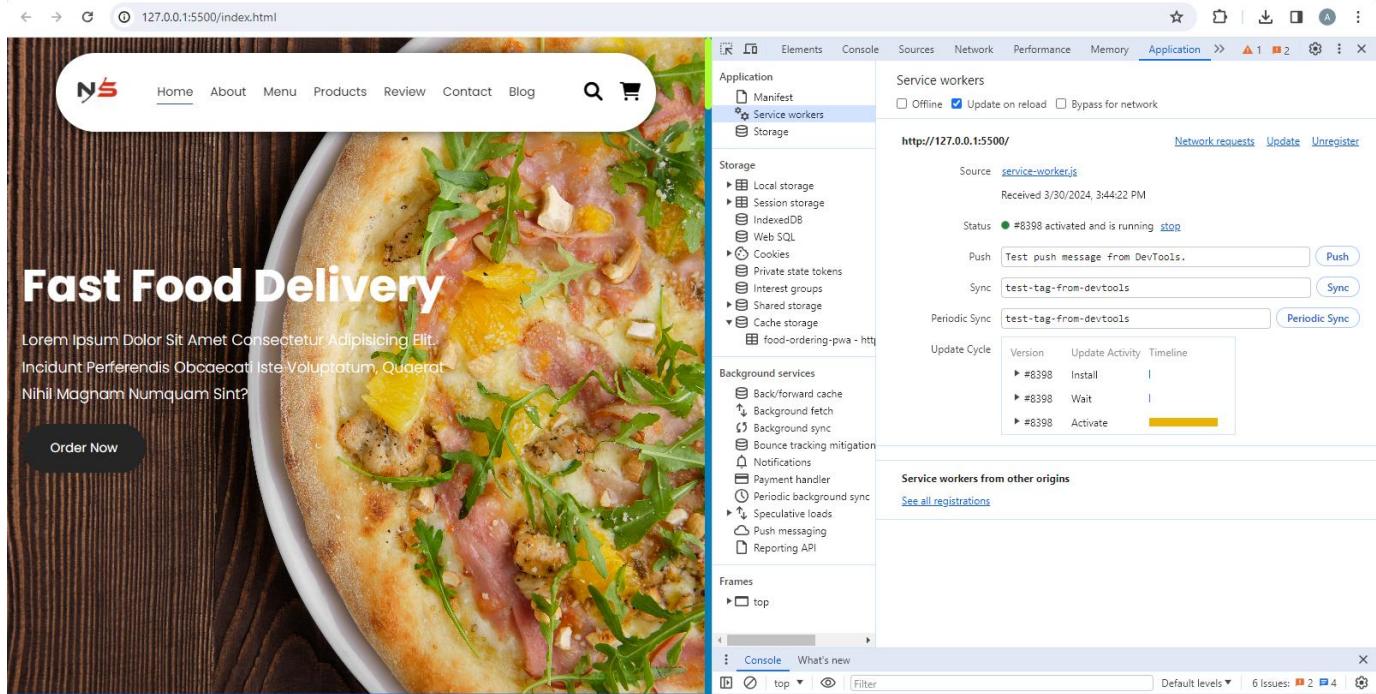

Output:

The screenshot shows a web browser window with a pizza delivery website loaded at 127.0.0.1:5500/index.html. The website features a large image of a pizza, a navigation bar with links like Home, About, Menu, Products, Review, Contact, Blog, and an Order Now button. The developer tools are open on the right side, specifically the Application tab. The Application tab displays the following information:

- Application** section: Shows Manifest, Service workers, and Storage.
- Storage** section: Shows Local storage, Session storage, IndexedDB, Web SQL, Cookies, Private state tokens, Interest groups, Shared storage, and Cache storage. The Cache storage section lists entries for the food-ordering-pwa - http://127.0.0.1:5500 domain, including entries for /, /about.html, /blog.html, /contact.html, /index.html, /menu.html, /products.html, /review.html, /script.js, and /style.css.
- Background services** section: Shows Back/forward cache, Background fetch, Background sync, Bounce tracking mitigation, Notifications, Payment handler, Periodic background sync, Speculative loads, Push messaging, and Reporting API.
- Frames** section: Shows top frame.

The developer tools also show a list of 10 total entries in the Cache storage table. A message at the bottom of the Application tab says "Select a cache entry above to preview". The browser's address bar shows the URL <http://127.0.0.1:5500>.

Conclusion:

In this experiment, we have registered a service worker, and completed the install and activation process for a new service worker for the PWA.

MAD AND PWA LAB

Name: Atharva Chavan

Class: D15A

Roll no: 10

Experiment – 9

Aim: To implement Service worker events like fetch , sync and push for E-commerce PWA.

Theory:

Service Worker

Service Worker is a script that works on browser background without user interaction independently. Also, It resembles a proxy that works on the user side. With this script, you can track network traffic of the page, manage push notifications and develop "offline first" web applications with Cache API.

Things to note about Service Worker:

- A service worker is a programmable network proxy that lets you control how network requests from your page are handled.
- Service workers only run over HTTPS. Because service workers can intercept network requests and modify responses, "man-in-the-middle" attacks could be very bad.
- The service worker becomes idle when not in use and restarts when it's next needed. You cannot rely on a global state persisting between events. If there is information that you need to persist and reuse across restarts, you can use IndexedDB databases.
- Service workers make extensive use of promises, so if you're new to promises, then you should stop reading this and check out Promises, an introduction.

Fetch Event

You can track and manage page network traffic with this event. You can check existing cache, manage "cache first" and "network first" requests and return a response that you want.

Of course, you can use many different methods but you can find in the following example a "cache first" and "network first" approach. In this example, if the request's and current location's origin are the same (Static content is requested.), this is called "cacheFirst" but if you request a targeted external URL, this is called "networkFirst".

- CacheFirst - In this function, if the received request has cached before, the cached response is returned to the page. But if not, a new response requested from the network.

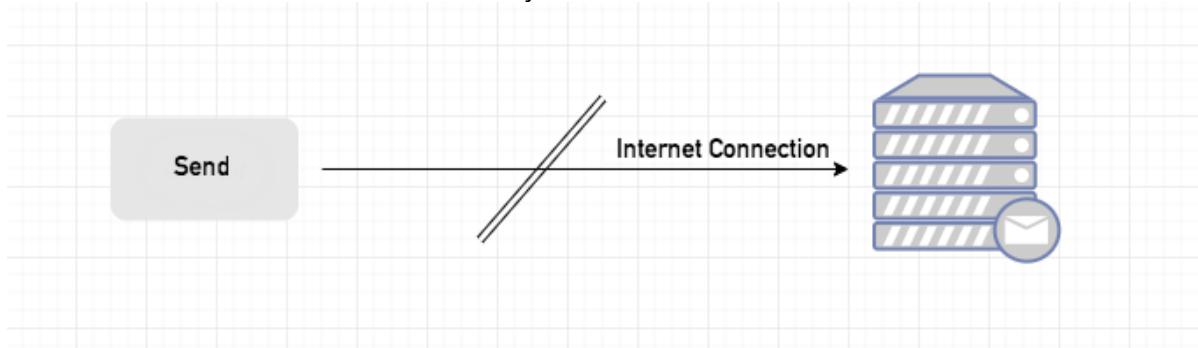

- NetworkFirst - In this function, firstly we can try getting an updated response from the network, if this process completed successfully, the new response will be cached and returned. But if this process fails, we check whether the request has been cached before or not. If a cache exists, it is returned to the page, but if not, this is up to you. You can return dummy content or information messages to the page.

Sync Event

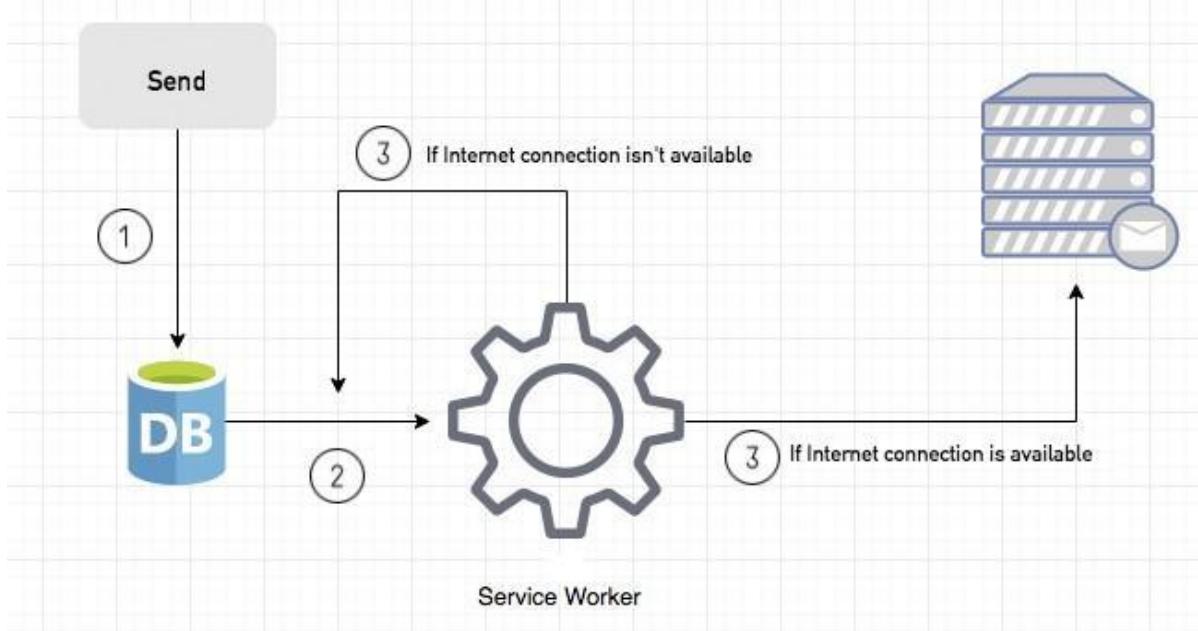

Background Sync is a Web API that is used to delay a process until the Internet connection is stable. We can adapt this definition to the real world; there is an e-mail client application that works on the browser and we want to send an email with this tool. Internet connection is broken while we are writing e-mail content and we didn't realize it. When completing the writing, we click the send button.

Here is a job for the Background Sync.

The following view shows the classical process of sending email to us. If the Internet Connection is broken, we can't send any content to Mail Server.

Here, you can create any scenario for yourself. A sample is in the following for this case.

1. When we click the "send" button, email content will be saved to IndexedDB.
2. Background Sync registration.
3. **If the Internet connection is available**, all email content will be read and sent to Mail Server.

If the Internet connection is unavailable, the service worker waits until the connection is available even though the window is closed. When it is available, email content will be sent to Mail Server.

You can see the working process within the following code block.

Push Event

This is the event that handles push notifications that are received from the server. You can apply any method with received data.

We can check in the following example.

"Notification.requestPermission();" is the necessary line to show notification to the user. If you don't want to show any notification, you don't need this line.

In the following code block is in sw.js file. You can handle push notifications with this event. In this example, I kept it simple. We send an object that has "method" and "message" properties. If the method value is "pushMessage", we open the information notification with the "message" property.

Code:

sw.js

```
self.addEventListener("install", function (event) {
  event.waitUntil(preLoad());
});

self.addEventListener("fetch", function (event) {
  event.respondWith(
    checkResponse(event.request).catch(function () {
      console.log("Fetch from cache successful!");
      return returnFromCache(event.request);
    })
  );
  console.log("Fetch successful!");
  event.waitUntil(addToCache(event.request));
});

self.addEventListener("sync", (event) => {
  if (event.tag === "syncMessage") {
    console.log("Sync successful!");
  }
});

self.addEventListener("push", function (event) {
  if (event && event.data) {
    try {
      var data = event.data.json();
    }
  }
});
```

```
        if (data && data.method === "pushMessage") {
            console.log("Push notification sent");
            self.registration.showNotification("Twiggy", {
                body: data.message,
            });
        }
    } catch (error) {
        console.error("Error parsing push data:", error);
    }
}
});

var preLoad = function () {
    return caches.open("offline").then(function (cache) {
        // caching index and important routes
        return cache.addAll([
            "/",
            "/index.html",
            "/style.css",
            "/app.js",
            "/blog.html",
            "/about.html",
            "/contact.html",
            "/menu.html",
            "/products.html",
            "/review.html",
            "/script.js",
        ]);
    });
};

var checkResponse = function (request) {
    return new Promise(function (fulfill, reject) {
        fetch(request)
            .then(function (response) {
                if (response.status !== 404) {
                    fulfill(response);
                } else {
                    reject(new Error("Response not found"));
                }
            })
            .catch(function (error) {
                reject(error);
            });
    });
};

var returnFromCache = function (request) {
    return caches.open("offline").then(function (cache) {
        return cache.match(request).then(function (matching) {
            if (!matching || matching.status == 404) {

```

```

        return cache.match("offline.html");
    } else {
        return matching;
    }
});
});
});
};

var addToCache = function (request) {
    return caches.open("offline").then(function (cache) {
        return fetch(request).then(function (response) {
            return cache.put(request, response.clone()).then(function () {
                return response;
            });
        });
    });
};

```

Output:

Fetch Event

The screenshot shows the Chrome DevTools Application tab for a service worker. The main pane displays the service worker's status as active and running, with a push message received from the worker. The sync message field contains "syncMessage". The periodic sync field is set to "test-tag-from-devtools". The update cycle table shows three entries: #8454 Install, #8454 Wait, and #8454 Activate. The network requests section at the bottom lists several successful fetches, including "service-worker.js", "index.html", "service-worker.js", "script.js", and "service-worker.js".

Push Event

The screenshot shows a web browser window with the URL `127.0.0.1:5500/index.html`. The main content is a "Fast Food Delivery" page featuring a large image of a pizza and a "Order Now" button. The DevTools sidebar is open, specifically the Application tab. In the Service workers section, it shows a service worker named `service-worker.js` is active and running. A log entry indicates a push notification was sent to the service worker. The Timeline section shows two entries: "Install" and "Wait". On the right, a developer tools window titled "Twiggy" shows a message from the service worker: "Hello, this is Atharva".

Sync Event

This screenshot is similar to the previous one, showing the same website and DevTools setup. However, the log in the Application tab shows a sync message instead of a push notification. The log entries include "Sync successful!" and "Sync syncMessage". The Timeline section shows the "Install" and "Wait" events. The Twiggy window on the right also displays a sync message from the service worker.

Conclusion:

In this experiment, we have successfully implemented service worker events like fetch, sync and push for E-commerce PWA and found out output for above implementation.

MAD & PWA Lab

Journal

Experiment No.	10
Experiment Title.	To study and implement deployment of Ecommerce PWA to GitHub Pages.
Roll No.	10

MAD and PWA Lab

Name: Atharva Chavan

Class: D15A

Roll no:10

Experiment - 10

Aim: To study and implement deployment of Ecommerce PWA to GitHub Pages.

Theory:

GitHub Pages

Public web pages are freely hosted and easily published. Public webpages hosted directly from your GitHub repository. Just edit, push, and your changes are live.

GitHub Pages provides the following key features:

1. Blogging with Jekyll
2. Custom URL
3. Automatic Page Generator

Reasons for favoring this over Firebase:

1. Free to use
2. Right out of github
3. Quick to set up

GitHub Pages is used by Lyft, CircleCI, and HubSpot.

GitHub Pages is listed in 775 company stacks and 4401 developer stacks.

Pros

1. Very familiar interface if you are already using GitHub for your projects.
2. Easy to set up. Just push your static website to the gh-pages branch and your website is ready.
3. Supports Jekyll out of the box.
4. Supports custom domains. Just add a file called CNAME to the root of your site, add an A record in the site's DNS configuration, and you are done.

Cons

1. The code of your website will be public, unless you pay for a private repository.
2. Currently, there is no support for HTTPS for custom domains. It's probably coming soon though.
3. Although Jekyll is supported, plug-in support is rather spotty.

Firebase

The Realtime App Platform. Firebase is a cloud service designed to power real-time, collaborative applications. Simply add the Firebase library to your application to gain access to a shared data structure; any changes you make to that data are automatically synchronized with the Firebase cloud and with other clients within milliseconds.

Some of the features offered by Firebase are:

1. Add the Firebase library to your app and get access to a shared data structure. Any changes made to that data are automatically synchronized with the Firebase cloud and with other clients within milliseconds.
2. Firebase apps can be written entirely with client-side code, update in real-time out-of-the-box, interoperate well with existing services, scale automatically, and provide strong data security.
3. Data Accessibility- Data is stored as JSON in Firebase. Every piece of data has its own URL which can be used in Firebase's client libraries and as a REST endpoint. These URLs can also be entered into a browser to view the data and watch it update in real-time.

Reasons for favoring over GitHub Pages:

1. Realtime backend made easy
2. Fast and responsive

Instacart, 9GAG, and Twitch are some of the popular companies that use Firebase
Firebase has a broader approval, being mentioned in 1215 company stacks & 4651 developers stacks

Pros

1. Hosted by Google. Enough said.
2. Authentication, Cloud Messaging, and a whole lot of other handy services will be available to you.
3. A real-time database will be available to you, which can store 1 GB of data.
4. You'll also have access to a blob store, which can store another 1 GB of data.
5. Support for HTTPS. A free certificate will be provisioned for your custom domain within 24 hours.

Cons

1. Only 10 GB of data transfer is allowed per month. But this is not really a big problem, if you use a CDN or AMP.
2. Command-line interface only.

Implementation:

The screenshot shows the GitHub repository page for 'Atharva089/restaurant-site-hosted'. The repository is public and forked from 'nsevindi87/multipage-website'. The main branch is 'main', which is 8 commits ahead of the 'nsevindi87/multipage-website:main' branch. The repository contains 32 commits, mostly from Atharva089, updating various files like 'image', 'README.md', 'about.html', 'blog.html', 'contact.html', 'index.html', 'menu.html', 'products.html', and 'review.html'. The repository has 0 stars, 0 forks, and 0 releases. The README file is present.

The screenshot shows the GitHub Pages settings page for the 'restaurant-site-hosted' repository. Under the 'General' tab, there are sections for 'Access', 'Collaborators', and 'Moderation options'. The 'Build and deployment' section is expanded, showing 'Source' set to 'Deploy from a branch' (with a dropdown menu), 'Branch' (disabled), and 'Visibility' (set to 'GITHUB ENTERPRISE'). The sidebar on the left includes sections for 'Code and automation' (Branches, Tags, Rules, Actions, Webhooks, Environments, Codespaces), 'Pages' (selected), 'Security' (Code security and analysis, Deploy keys, Secrets and variables), and 'Visibility' (GitHub Enterprise risk-free for 30 days).

MAD and PWA Lab

Name: Atharva Chavan

Class: D15A

Roll no:10

Experiment – 11

Aim : To use google Lighthouse PWA Analysis Tool to test the PWA functioning.

Theory:

Google Lighthouse :

Google Lighthouse is a tool that lets you audit your web application based on a number of parameters including (but not limited to) performance, based on a number of metrics, mobile compatibility, Progressive Web App (PWA) implementations, etc. All you have to do is run it on a page or pass it a URL, sit back for a couple of minutes and get a very elaborate report, not much short of one that a professional auditor would have compiled in about a week.

The best part is that you have to set up almost nothing to get started. Let's begin by looking at some of the top features and audit criteria used by Lighthouse.

Key Features and Audit Metrics

Google Lighthouse has the option of running the Audit for Desktop as well as mobile version of your page(s). The top metrics that will be measured in the Audit are:

1. **Performance:** This score is an aggregation of how the page fared in aspects such as (but not limited to) loading speed, time taken for loading for basic frame(s), displaying meaningful content to the user, etc. To a layman, this score is indicative of how decently the site performs, with a score of 100 meaning that you figure in the 98th percentile, 50 meaning that you figure in the 75th percentile and so on.
2. **PWA Score (Mobile):** Thanks to the rise of Service Workers, app manifests, etc., a lot of modern web applications are moving towards the PWA paradigm, where the objective is to make the application behave as close as possible to native mobile applications. Scoring points are based on the Baseline PWA checklist laid down by Google which includes Service Worker implementation(s), viewport handling, offline functionality, performance in script-disabled environments, etc.

3. **Accessibility:** As you might have guessed, this metric is a measure of how accessible your website is, across a plethora of accessibility features that can be implemented in your page (such as the ‘aria-’ attributes like aria-required, audio captions, button names, etc.). Unlike the other metrics though, Accessibility metrics score on a pass/fail basis i.e. if all possible elements of the page are not screen-reader friendly (HTML5 introduced features that would make pages easy to interpret for screen readers used by visually challenged people like tag names, tags such as <section>, <article>, etc.), you get a 0 on that score. The aggregate of these scores is your Accessibility metric score.
4. **Best Practices:** As any developer would know, there are a number of practices that have been deemed ‘best’ based on empirical data. This metric is an aggregation of many such points, including but not limited to:
 - Use of HTTPS
 - Avoiding the use of deprecated code elements like tags, directives, libraries, etc.
 - Password input with paste-into disabled
 - Geo-Location and cookie usage alerts on load, etc.

Code & Output:

`manifest.json:`

```
{
  "name": "Fast Food Delivery",
  "start_url": "index.html",
  "display": "standalone",
  "background_color": "#5900b3",
  "theme_color": "black",
  "scope": ".",
  "description": "This is a Fast food delivery app.",
  "icons": [
    {
      "src": "image/cropped.jpg",
      "sizes": "192x192",
      "type": "image/png"
    },
    {
      "src": "image/CompressJPEG.online_512x512_image.jpg",
      "sizes": "512x512",
      "type": "image/png"
    }
  ]
}
```

Lighthouse Audit Results:

- Performance: 67
- Accessibility: 71
- Best Practices: 96
- SEO: 90
- PWA: 67

Performance

Values are estimated and may vary. The [performance score is calculated](#) directly from these metrics. [See calculator.](#)

Range	Count
0–49	▲
50–89	■
90–100	●

METRICS

- First Contentful Paint: 0.9 s
- Largest Contentful Paint: 19.1 s

Lighthouse Audit Results:

- Performance: 64
- Accessibility: 71
- Best Practices: 96
- SEO: 98
- PWA: 64

PWA

These checks validate the aspects of a Progressive Web App. [Learn what makes a good Progressive Web App.](#)

INSTALLABLE

- Web app manifest or service worker do not meet the installability requirements — 1 reason

PWA OPTIMIZED

- Is not configured for a custom splash screen. Failures: No manifest was fetched.
- Does not set a theme color for the address bar. Failures: No manifest was fetched. No <meta name="theme-color"> tag found.
- Content is sized correctly for the viewport.
- Has a <meta name="viewport"> tag with width OR initial-scale.
- Manifest doesn't have a maskable icon. Failures: No manifest was fetched.

After Changes made to the manifest.json :

```
{
  "name": "Fast Food Delivery",
  "start_url": "index.html",
  "display": "standalone",
  "background_color": "#5900b3",
```

```
"theme_color":"black",
"scope": ".",
"description":"This is a Fast food delivery app.",
"icons":[
{
  "src":"image/cropped.jpg",
  "sizes":"192x192",
  "type":"image/png",
  "purpose":"any maskable"
},
{
  "src":"image/CompressJPEG.online_512x512_image.jpg",
  "sizes":"512x512",
  "type":"image/png",
  "purpose":"any maskable"
}
]
}
```

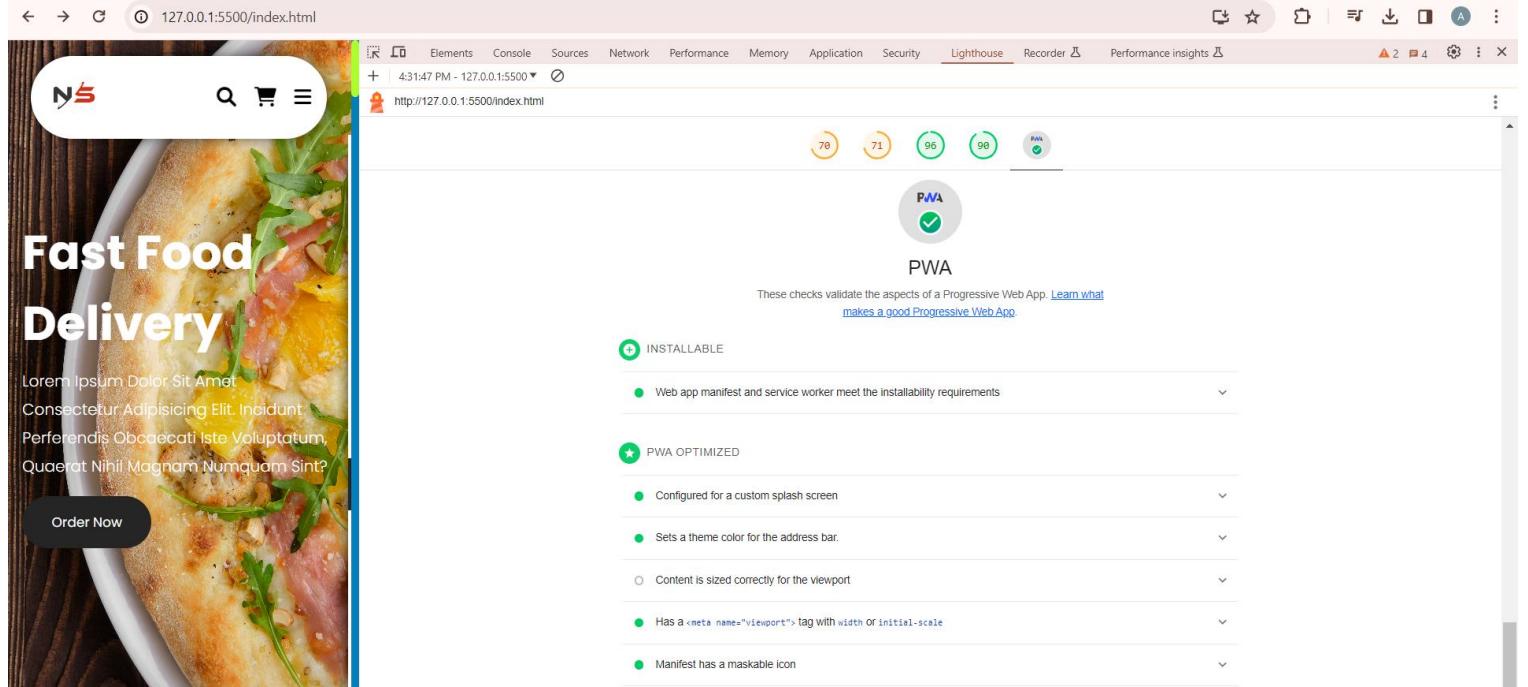

For theme color add a meta tag in index.html-

```
<meta name="theme-color" content="#4285f4">
```

For a maskable icon add "purpose": "any maskable" to the icons in manifest.json file

For apple touch icon add the following meta tag in index.html-

```
<link rel="apple-touch-icon" href="">
```

Conclusion:

- We analyzed the website with the help of lighthouse tool and found some issues with the website
- Hence we made changes in the manifest.json file we added "purpose":"any maskable" for maskable error face
- Also added a meta tag in index.html to resolve the theme error faced

FLUTTER ASSIGNMENT

Q. 1

Key features of Flutter :

- (1) Single codebase for multiple platforms - Flutter allows developers to write code & deploy it on both iOS & Android platform.
- (2) Hot Reload - This enables developers to instantly see the results of the code changes they make.
- (3) Expressive UI - Developers have the flexibility to create expressive & flexible UI.
- (4) Integration with other tools - Flutter can easily integrate with other popular development tools & frameworks.

Advantages of Flutter :

- (1) Faster development - Uses single codebase for multiple platforms.
- (2) Consistent UI across platforms - Widgets provide a consistent look & feel across different platforms.
- (3) Cost efficiency - Developing & maintaining single codebase for both iOS & Android reduces development cost & resources.

~~(1)~~
~~(2)~~
~~(3)~~

Differ from Traditional Approach :

- (1) Traditional approach uses a hierarchical structure for UI components whereas Flutter uses widget-based approach.
- (2) Flutter compiles to native ARM code, providing performance comparable to native applications.
- (3) Hot reloads allow to see changes made instantly.

Flutter's popularity is driven by increased productivity, a growing community, flexibility in UI design, cross-platform development capabilities & adoption by major companies.

Q. 2] Widget Tree:

- ① The widget tree is hierarchical structure of widgets that define the user interface of an application.
- ② Every visual element from simple components to complex layout is represented by a widget.
- ③ Widget can be categorized in 2 types :

A] Stateless Widget :

It is immutable & cannot change over time.
eg:- text, images, etc.

B] Stateful Widget :

Widget that can change its state over time
eg:- buttons, form

Widget Composition:

- ① Widget composition in Flutter involves combining multiple simple widget to create more complex & compound widget.
- ② This composability is powerful concept that allows developers to build sophisticated user interfaces by nesting widgets within each other.

Commonly Used Widget:

- (1) Container - A box model for padding, margin & decoration.
- (2) Column & Row - Layout widgets for arranging children vertically or horizontally.
- (3) Stack - Overlapping widgets, allowing them to be layered on top of each other.
- (4) List view - A scrollable list of widget
- (5) Grid view - A scrollable grid of widgets
- (6) AppBar - A material design app bar typically at the top of screen.
- (7) TextField - An input field for users to enter text
- (8) Button widget - Interactive buttons for user actions.

Q. 3] State Management in Flutter :

- (1) State management is crucial in flutter application because it involves managing the data that can change over time.
- (2) Flutter is reactive, rearing the UI rebuilds when the underlying data changes.

	set State	Provider	Riverpod
(1)	Built in flutter method .	(1) External package named ('provider')	(1) External package ('riverpod')

(2) Local state within a widget	(2) Global state within a widget tree	(2) Global state with additional features.
(3) Limited scalability for large apps.	(3) Suitable for medium sized apps.	(3) Design for large & complex apps.
(4) May lead to code redundancy.	(4) Balances simplicity & readability.	(4) Emphasizes readability & clear syntax.
(5) Testing can be more challenging.	(5) Good testability support.	(5) Enhanced testing experience.
(6) Widely used & well established.	(6) Widely adopted & well supported	(6) Gaining popularity & growing community.

Scenarios where each is applicable :

(1) useState :

- i) For small to moderately complex applications
- ii) When managing local state within a widget
e.g.: simple forms, UI components with local UI specific state.

(2) Provider :

- i) For medium to large scale application .
- ii) When a centralized state is used within a widget .

eg :- Managing user authentication , theme change or app - wide configuration .

(3) Riverpod :

- i) For large & complex application .
- ii) When testability & maintainability are top priorities .

eg :- complex application with multiple feature , dynamic UI .

Q. 4] Integration :

- ① Go to Firebase console & create a new project .
- ② Add Firebase SDK by adding dependencies in pubspec.yaml file .

Dependencies :

flamefire-core : ^ version
firebase-auth : ^ version
cloud-firebase : ^ version

- ③ Run flutter get pub

- ④ Initialise Firebase by calling :
`'Firebase.initializeApp()'` in main

```
import 'package:firebase_core/firebase_core.dart';

void main() async {
  WidgetsFlutterBinding.ensureInitialized();
  await Firebase.initializeApp();
  runApp(MyApp());
}
```

Benefits of using Firebase as Backend :

① Real time database :-

Firebase offers real time NoSQL database

② Authentication :-

Provides a secure & easy - to implement solution for user authentication .

③ Cloud firebase :-

Firebase's cloud firestore provides a secure & easy - to implement scalable NoSQL database that allows you to store & sync data in real time .

④ Hosting :

Firebase hosting provides a simple & efficient way to deploy & host web application .

Data Synchronization :-

(1) Real-time database :-

When data changes on one client, it triggers event automatically update data on other clients.

(2) Cloud Firestore :-

It notifies client when data changes, allowing for seamless real-time updates.

(3) Authentication :-

If the user sign in or out on one device, the authentication state is automatically reflected on other devices.

Flutter's popularity is driven by increased productivity, a growing community, flexibility in UI design, cross-platform development capabilities & adoption by major companies.

Q. 2] Widget Tree:

- ① The widget tree is hierarchical structure of widgets that define the user interface of an application.
- ② Every visual element from simple components to complex layout is represented by a widget.
- ③ Widget can be categorized in 2 types :

A] Stateless Widget :

It is immutable & cannot change over time.
eg:- text, images, etc.

B] Stateful Widget :

Widget that can change its state over time
eg:- buttons, form

Widget Composition:

- ① Widget composition in Flutter involves combining multiple simple widget to create more complex & compound widget.
- ② This composability is powerful concept that allows developers to build sophisticated user interfaces by nesting widgets within each other.

Commonly Used Widget:

- (1) Container - A box model for padding, margin & decoration.
- (2) Column & Row - Layout widgets for arranging children vertically or horizontally.
- (3) Stack - Overlapping widgets, allowing them to be layered on top of each other.
- (4) List view - A scrollable list of widget
- (5) Grid view - A scrollable grid of widgets
- (6) AppBar - A material design app bar typically at the top of screen.
- (7) TextField - An input field for users to enter text
- (8) Button widget - Interactive buttons for user actions.

Q. 3] State Management in Flutter :

- (1) State management is crucial in flutter application because it involves managing the data that can change over time.
- (2) Flutter is reactive, rearing the UI rebuilds when the underlying data changes.

	set State	Provider	Riverpod
(1)	Built in flutter method .	(1) External package named ('provider')	(1) External package ('riverpod')

(2) Local state within a widget	(2) Global state within a widget tree	(2) Global state with additional features.
(3) Limited scalability for large apps.	(3) Suitable for medium sized apps.	(3) Design for large & complex apps.
(4) May lead to code redundancy.	(4) Balances simplicity & readability.	(4) Emphasizes readability & clear syntax.
(5) Testing can be more challenging.	(5) Good testability support.	(5) Enhanced testing experience.
(6) Widely used & well established.	(6) Widely adopted & well supported	(6) Gaining popularity & growing community.

Scenarios where each is applicable :

(1) useState :

- i) For small to moderately complex applications
- ii) When managing local state within a widget
e.g.: simple forms, UI components with local UI specific state.

(2) Provider :

- i) For medium to large scale application .
- ii) When a centralized state is used within a widget .

eg :- Managing user authentication , theme change or app - wide configuration .

(3) Riverpod :

- i) For large & complex application .
- ii) When testability & maintainability are top priorities .

eg :- complex application with multiple feature , dynamic UI .

Q. 4] Integration :

- ① Go to Firebase console & create a new project .
- ② Add Firebase SDK by adding dependencies in pubspec.yaml file .

Dependencies :

flamefire-core : ^ version
firebase-auth : ^ version
cloud-firebase : ^ version

- ③ Run flutter get pub

- ④ Initialise Firebase by calling :
`'Firebase.initializeApp()'` in main

```
import 'package:firebase_core/firebase_core.dart';

void main() async {
  WidgetsFlutterBinding.ensureInitialized();
  await Firebase.initializeApp();
  runApp(MyApp());
}
```

Benefits of using Firebase as Backend :

① Real time database :-

Firebase offers real time NoSQL database

② Authentication :-

Provides a secure & easy-to implement solution for user authentication.

③ Cloud firestore :-

Firebase's cloud firestore provides a secure & easy-to implement scalable NoSQL database that allows you to store & sync data in real time.

④ Hosting :

Firebase hosting provides a simple & efficient way to deploy & host web application.

Data Synchronization :-

(1) Real-time database :-

When data changes on one client, it triggers event automatically update data on other clients.

(2) Cloud Firestore :-

It notifies client when data changes, allowing for seamless real-time updates.

(3) Authentication :-

If the user sign in or out on one device, the authentication state is automatically reflected on other devices.

MAD & PWA Lab

Journal

Experiment No.	Assignment-2
Assignment 2 Questions	<ol style="list-style-type: none"> Define Progressive Web App (PWA) and explain its significance in modern web development. Discuss the key characteristics that differentiate PWAs from traditional mobile apps Define responsive web design and explain its importance in the context of Progressive Web Apps. Compare and contrast responsive, fluid, and adaptive web design approaches. Describe the lifecycle of Service Workers, including registration, installation, and activation phases. Explain the use of IndexedDB in the Service Worker for data storage.
Roll No.	10
Name	Atharva Chavan
Class	D15A
Subject	MAD & PWA Lab
Lab Outcome	LO4:Understand various PWA frameworks and their requirements LO5: Design and Develop a responsive User Interface by applying PWA Design techniques LO6:Develop and Analyze PWA Features and deploy it over app hosting solutions
Grade:
